

# DAVE Datafile Examiner Help File

## What Is The DAVE Datafile Examiner?

The DAVE Datafile Examiner displays the contents of a .dave save file. The left pane of the window displays the DAVE hierarchy. Structures are represented as folders and other file types are represented as files. The right pane of the window will display the data type and contents of any “file” you select.

## Issues

- The datafile examiner does not handle formatting of arrays with more than two dimensions. Three dimensional arrays or higher will simply be displayed line by line.
- The datafile examiner is not able to handle objects. Only simple data types and structures. You can open datafiles with this tool, but it may cause some small memory leak.
